List of Acronyms and Abbreviations

1. Introduction

1.1 Introduction to Fire Alarm Monitoring System

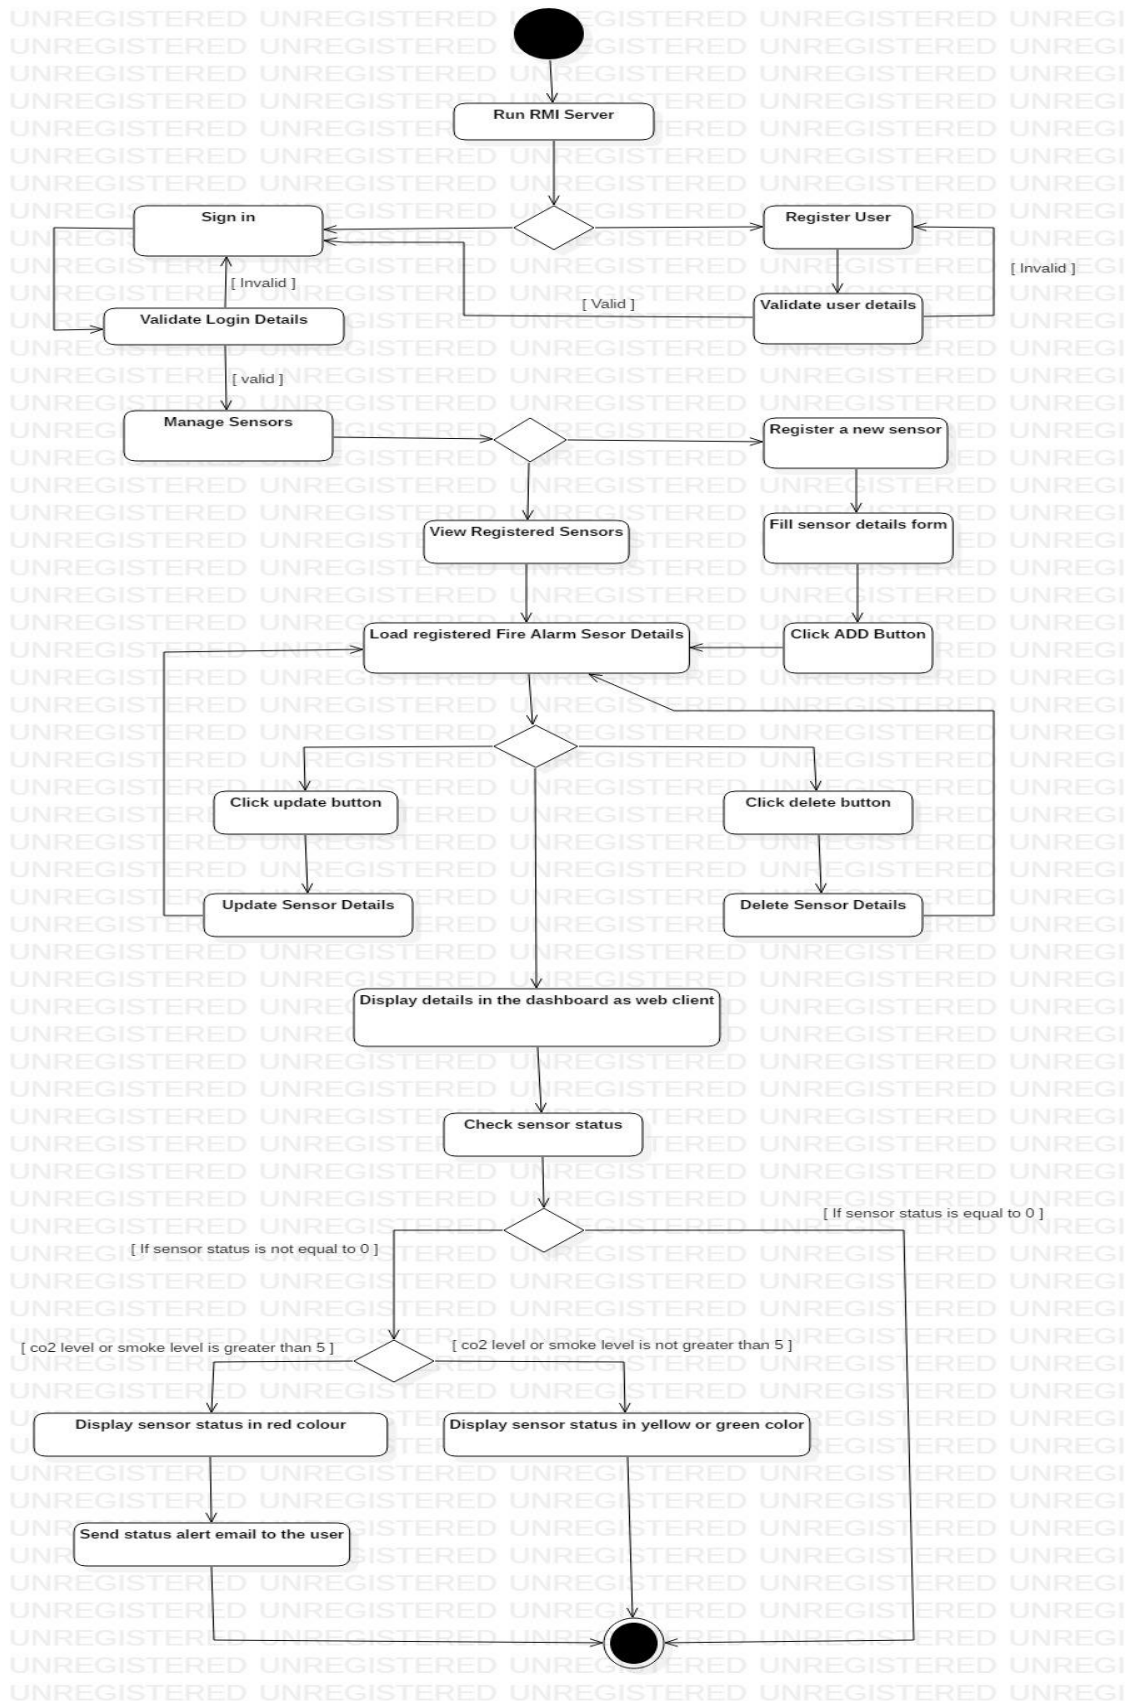

The Fire Alarm Monitoring system has a web client application and desktop client application. Analyze system status, giving alerts according to the details of the system and add/register/edit new fire alarm sensors are the main features of the system.

In web client application users can view the status of all fire alarm sensors. For each sensor, the web application displays the status of the fire alarm sensor (active or deactive), the location (floor no, room no), the smoke level (1-10) and the CO2 level (1-10 scale). If the smoke level or CO2 level is above 5, then they should be marked in red. These sensor details are updated every 40 seconds.

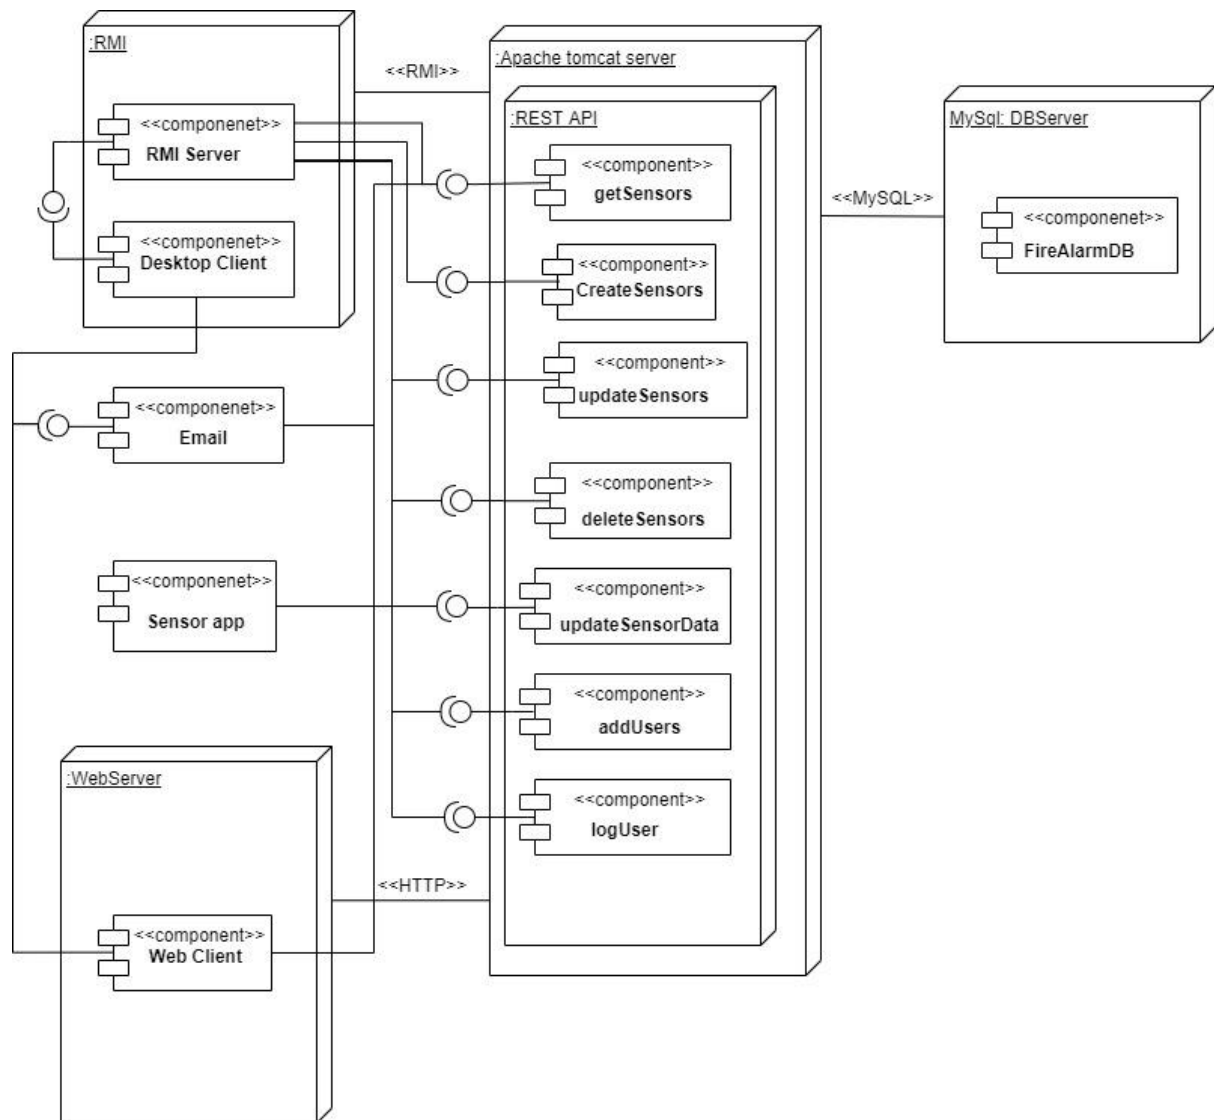

In desktop client application users can view the same information from a desktop client. The information is refreshed every 30 seconds. Also the desktop client application has an administrator login. Using this administrator login, administrator can add/register new fire alarm sensors by giving floor number and the room as the details. The administrator can edit sensor details as well. When the CO2 level or Smoke level is moved to a value greater than 5 in any sensor, an alert is displayed to the desktop client. If the co2 level or smoke level is greater than 5, sensor status will be displayed in red colour and an email will be sent by the system in such situations. If the co2 level or smoke level is less than 5, sensor status will be displayed in Yellow or green colour.

1.2 High-Level Architecture Diagram

Activity Diagram

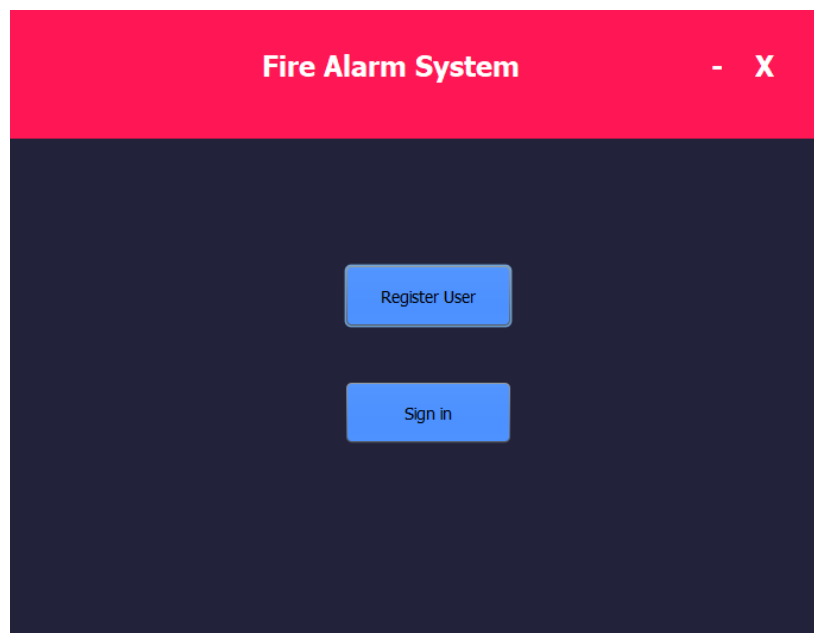

Physical Diagram

1.3 Service interfaces exposed by each service & workflows used in the system

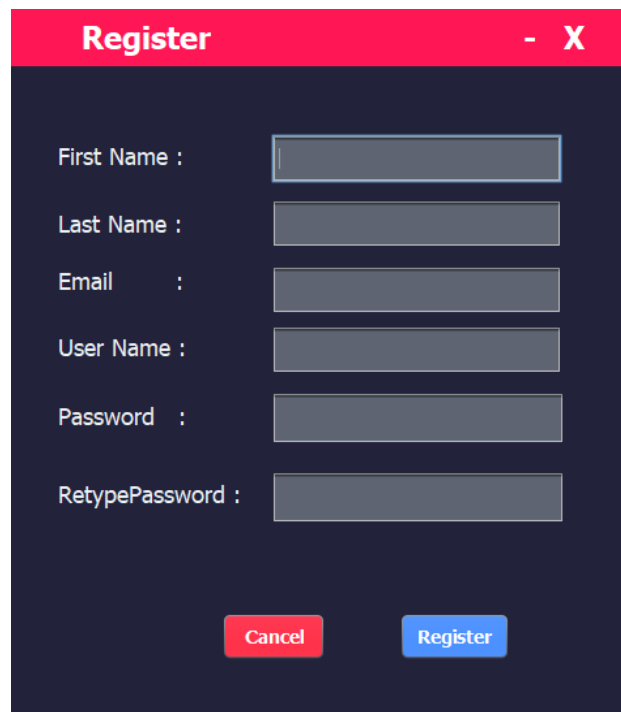

Home

This is the Home interface users will see when they run the RMI Program. In the home of the fire alarm monitoring system users can access two options. Unregistered users can register as the new user to the system by clicking the Register User button. Registered users can login to the system by clicking the sign in button.

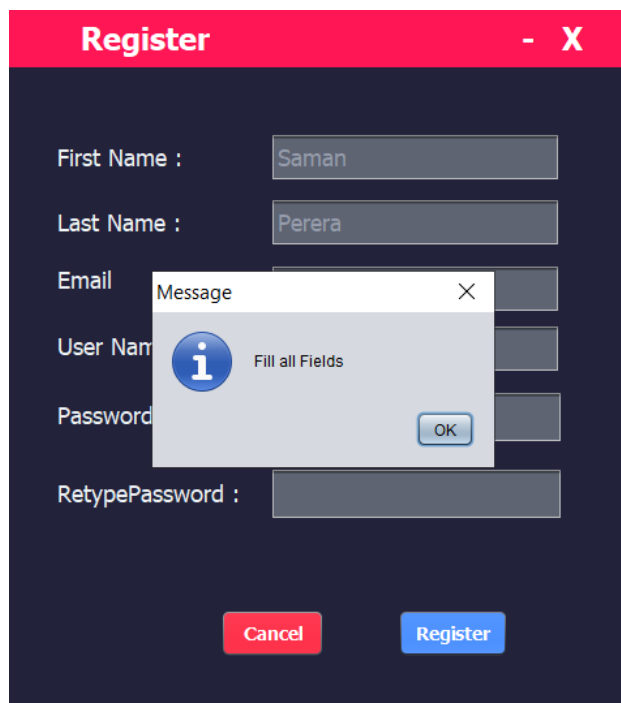

User Registration

Once click the Register user button users will get a user registration interface. Unregistered users can register to the fire alarm monitoring system using this user registration interface by giving First Name, Last Name, Email, Username and Password as the details. After clicking the Register button in the User Registration interface new user can access the Login Form interface.

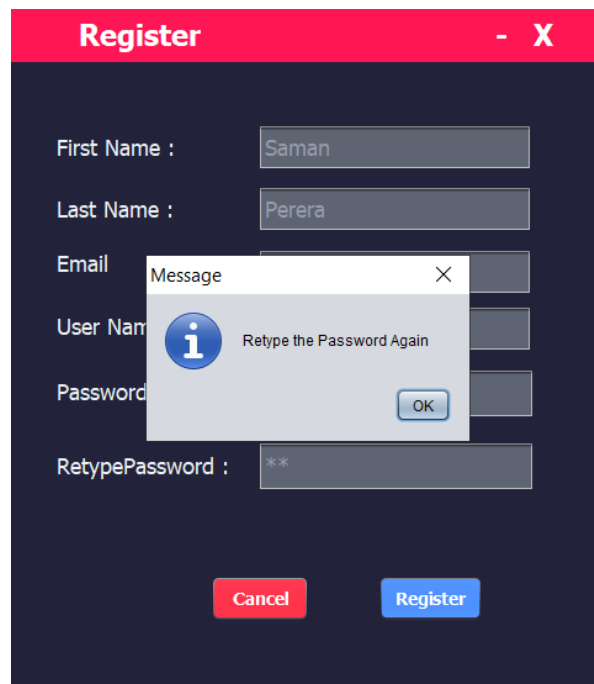

The image shows a 'Register' window with a red title bar containing the text 'Register' and a close button 'X'. The window has a dark blue background. It contains six input fields with labels: 'First Name :', 'Last Name :', 'Email :', 'User Name :', 'Password :', and 'RetypePassword :'. Each label is followed by an empty text input box. At the bottom of the window, there are two buttons: a red 'Cancel' button and a blue 'Register' button.

Users need to fill all the details in order to register to the fire alarm monitoring system. Otherwise the system will display Pop Up box saying “Fill All Fields” message.

The image shows the same 'Register' window as above, but with some input fields filled: 'First Name' contains 'Saman' and 'Last Name' contains 'Perera'. A modal message box is overlaid on the form. The message box has a title bar 'Message' and a close button 'X'. It contains an information icon (a blue circle with a white 'i') and the text 'Fill all Fields'. There is an 'OK' button at the bottom right of the message box. The background form is partially obscured by the message box.

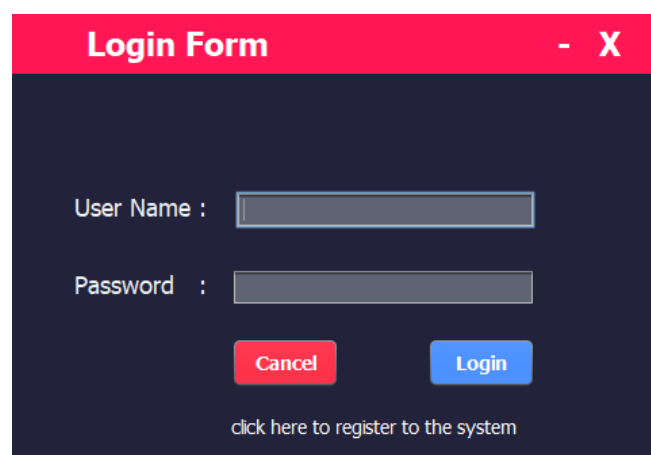

Users need to add password and confirm password to register to the fire alarm monitoring system. Otherwise the system will display Pop Up box saying “Retype the password again” message.

The screenshot shows a 'Register' form with a red header bar containing the title 'Register' and window controls. The form fields include 'First Name' (filled with 'Saman'), 'Last Name' (filled with 'Perera'), 'Email', 'User Name', 'Password', and 'RetypePassword'. A modal message box is displayed over the form, titled 'Message', with an information icon and the text 'Retype the Password Again'. It has an 'OK' button. At the bottom of the form are 'Cancel' and 'Register' buttons.

User Login

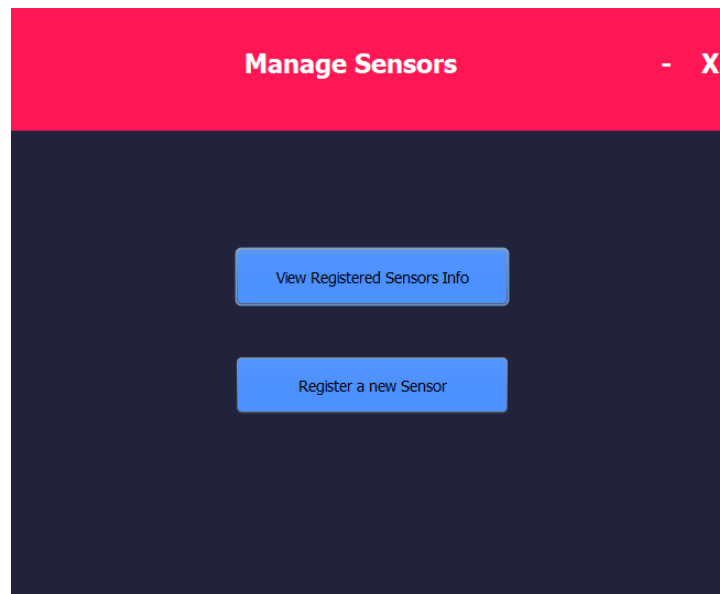

Pre-registered users can access the Login Form interface straightforwardly from the home by clicking the sign-in button. Once clicking the Register button in user registration from new users can access the Login Form interface. After entering the username and the password, users can click the Login button to access the Manage Sensors interface.

The screenshot shows a 'Login Form' with a red header bar containing the title 'Login Form' and window controls. The form has two input fields: 'User Name' and 'Password'. Below the fields are 'Cancel' and 'Login' buttons. At the bottom, there is a link that says 'click here to register to the system'.

Manage Sensors

In Manage sensor interface users can see two options. Users can view sensor details by clicking the View registered sensor info button and register new fire alarms to the system by clicking the Register a new sensor button .

View Registered Sensor Information

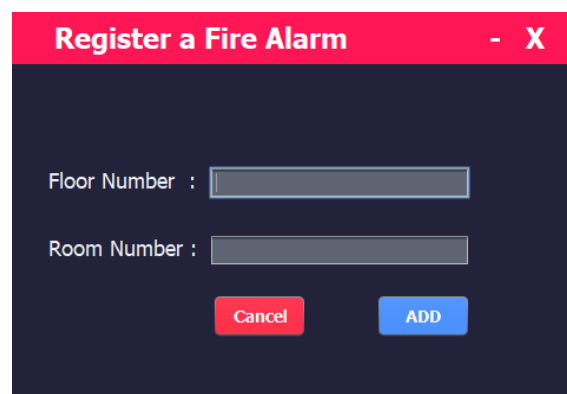

Once clicking the View registered sensor info button in Manage sensor interface users can view details of the registered fire alarm sensors in the Fire Alarm Monitoring system. All the registered sensors details are displayed using a table.

All Registered Sensor Details							
Sensor ID	Co2 Level	Smoke Level	Floor Number	Room Number	Sensor status	Action	
1	4	3	F1	F101	0	Deactive	
2	5	7	F2	F203	1	Active	
3	2	8	F3	F304	1	Active	
4	4	1	F3	F305	0	Deactive	
5	5	7	F1	F102	1	Active	
6	6	9	F2	F206	1	Active	

Fire alarm sensor Registration

Once clicking the Register a new sensor button in the Manage Sensors interface users can register new fire alarms to the system by giving Floor Number and Room Number as the details. A new sensor can be assigned to the related Floor Number and Room Number using this interface.

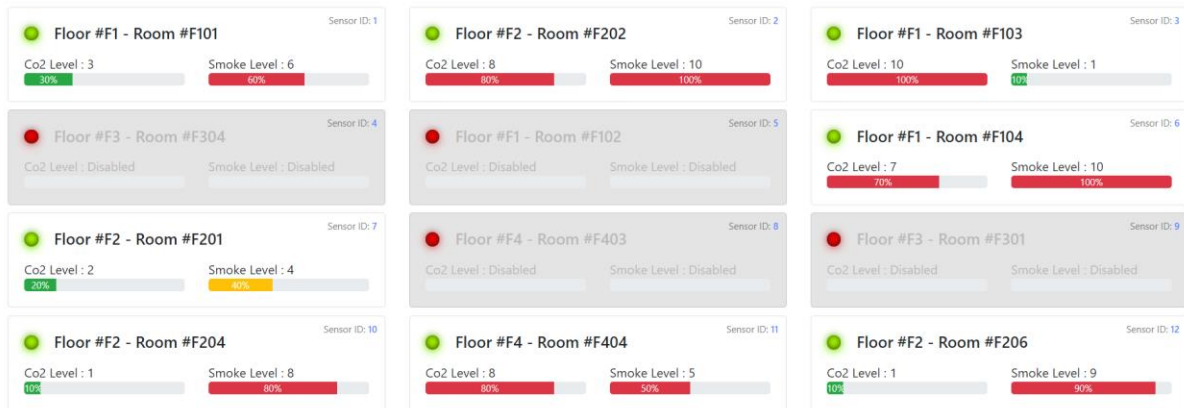

By clicking the ADD button users can view details of the registered fire alarm sensors in the Fire Alarm Monitoring system. (All the registered sensors details are displayed using a table and this interface is the same interface users can see, when they click the View registered sensor info button through the Manage sensor interface.)

A screenshot of a web application dialog box titled "Register a Fire Alarm" with a red header bar containing a close button (X). The dialog has a dark blue background. It contains two input fields: "Floor Number :" and "Room Number :", each followed by a text input box. At the bottom, there are two buttons: a red "Cancel" button and a blue "ADD" button.

Web Client (Sensor Dashboard)

Once a user runs a sensor-web-client project, automatically the browser will open and show the web client. Sensor Dashboard displays the details about all the sensors that assign to the particular room no and floor no. The web client sensor details are refreshed every 40 seconds according to the co2 level and smoke level. All the percentages are illustrated in the sensor dashboard using respective colours. If the co2 level or smoke level is greater than 5, sensor status will be displayed in red colour. If the co2 level or smoke level is less than 5, sensor status will be displayed in Yellow or green colour.

Sensor Dashbord

1.4 Authentication/Security mechanisms for Fire Alarm Monitoring System

To ensure the system is secure the analysis should be performed through the entire system. By creating threat Modelling gives theoretical insight into the security level of every element of the system with the possibility to provide controls for any potential attack or failure. [1]

Sensed data can be saved on the internet using web-based technologies. Utilizing this technology, users can access data remotely as long as they have an internet connection. Numerous WSN applications can be developed using smartphones as the gateway between sensor networks or the user and the internet. This mobile network enables the sensor network to be mobile and guarantees the security of the system. The advantage of the web-based WSN monitoring architecture for fire detection means that it gives a mechanism for allowing professionals to access sensed data remotely using an internet connection. [2]
